

Question: Is there a relationship between QB Salary and W-L%?

Key Findings:

- about 4.9% of the variance in a team's Winning-Loss Percentage (W-L%) can be explained by the QB's salary.
- Every Additional million dollars in QB salary, the W-L% is estimated to increase by 0.0021 percentage points
- We do not find statistically significant evidence to conclude that QB salary has a linear relationship with W-L% in this model.
- No Violations of OLS Assumptions

Main Conclusion: QB salary alone is not a strong predictor of W-L%
