

# Social Media and Sleep by Gender

Esther Park, Anne Kurian, Connor  
Northcott

Q: Does gender affect the relationship between time spent on social media and sleep for students?

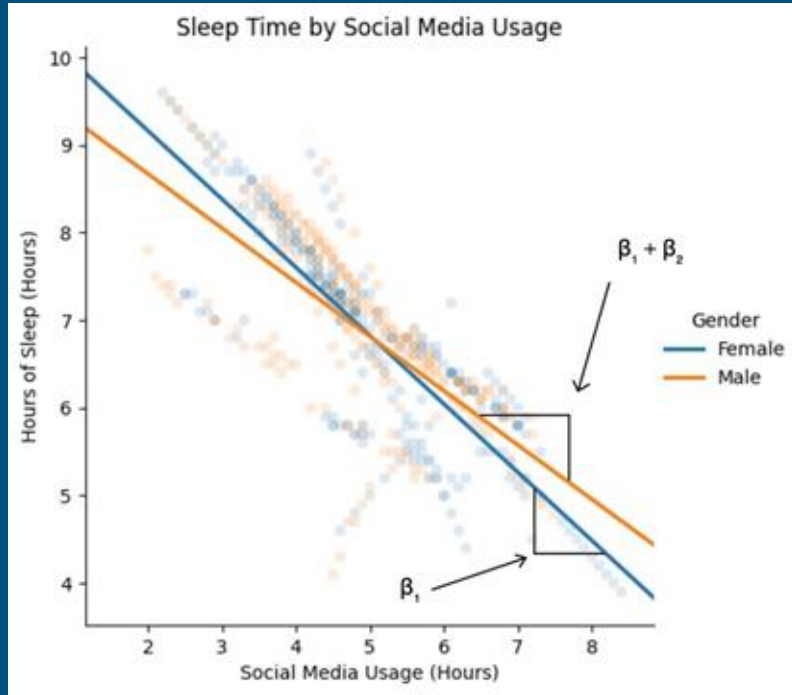

Distribution of sleep hours

Null hypothesis: Gender does not affect the relationship between social media usage and sleep time for students.

Alternative hypothesis: Gender does affect the relationship between social media and sleep time.

# Regression Model

## Results and Conclusion

## Regression

- Female Sleep =  $10.7199 - 0.779(\text{Social Media Hours})$
- Male Sleep =  $9.9076 - 0.6166(\text{Social Media Hours})$
- All p-values : 0.000 -----> Reject null hypothesis

## Conclusion

- Gender does have an influence on the relationship between social media usage and sleep.
- Men lose on average 0.1604 ( $\beta_2$ ) less hours of sleep for every hour of social media usage than women.

$$\text{Sleep} = \beta_0 + \beta_1(\text{SocialMedia}) + \beta_2(\text{SocialMedia} \times \text{Male}) + \epsilon$$
