

Does data center capacity per state predict state-level electricity prices while controlling for population, urbanization, and natural gas consumption?

Matthew Ketas
Ivan Zheng

Control: Population

Control: Urban Percent

Control: Natural Gas Consumption

R² Comparison

Effect of Data Center Capacity on Electricity Prices
(Controlling for All Variables)

$$\text{Electricity Price} = \beta_0 + \beta_1(\text{DataCenterCapacity}) + \beta_2(\text{Population}) + \beta_3(\% \text{Urban}) + \beta_4(\text{NaturalGasConsumption}) + \varepsilon$$

Weak and Positive

Takeaways:

- Data centers are most likely built where energy is cheap.
- Energy markets are very diverse or omitted variable bias
- Short term spikes aren't recorded in the data

Is there a relationship between voter turnout and county urbanness?

Castner, Vaughan

Null Hypothesis (H0):

The urbanness of a county has no impact on its voter turnout.

Alternative Hypothesis (HA):

The urbanness of a county has an impact on its voter turnout.

$$\log_voterturnout = \beta_0 + \beta_1 * (\text{rural_urban}) + \beta_2 * (\text{personalincomethousand}) + \varepsilon$$

A relationship exists between county urbanness and voter turnout.

Rural/urban coefficient: -0.127; p-value = 0.001

Income coefficient: 0.0012, p-value = 0.000

- OLS assumption of equal variance violated, with residual plot showing heteroskedasticity.

- Conclusion: Voter turnout decreases from rural to urban areas when controlling for income by 0.127 points.

Does government support of agriculture and GDP growth affect the food inflation rate?

$$\Delta \text{ Food Inflation Rate} = \beta_0 + \beta_1 \times \text{Lagged GDP Growth} + \beta_2 \times \text{Lagged Agricultural Support} + \epsilon$$

Every 1-unit increase of agricultural support difference from the prior year is associated with a **0.1258 food inflation rate change** in the current year **holding the prior year's GDP growth constant.** (p value = 0.034)

Every 1% increase in the prior year's GDP Growth is associated with a **0.3457 food inflation rate change** in the current year **holding the prior year's change in agricultural support constant.** (p value = 0.002)

Conclusion: GDP growth and change in the number of agricultural support policies are both associated with a change in food inflation rate.

What factors determine Airbnb listing prices in Amsterdam?

Maya Beresteanu

Uncontrolled model:

$$\text{Price} = \beta_0 + \beta_1 * \text{Reviews}_i + \varepsilon_i$$

Limitations: Should interpret with caution due to skewed price data and heteroskedasticity, which may affect the precision of the estimates.

Controlled model:

$$\text{Price} = \beta_0 + \beta_1 * \text{Reviews}_i + \beta_2 * \text{RoomType}_i + \varepsilon_i$$

Do NBA players with greater wingspan advantages shoot from further distances, whether they are interior or perimeter players?

HECTOR SANCHEZ & AJ ACCOLLA – 4/31/2026

Results: Wingspan vs. Average FG Distance by player Attribute

Experiment Data:

- Null Hypothesis: $\beta_1 = 0$
- Slope P-value= 0.066
- Interaction P-value= 0.989

Experiment Outcomes:

- Wingspan advantage affects shooting for both types of players the same

Higher GDP, longer lives

2023 World Bank data, 203 countries

Each dot is a country; the line is the fitted OLS relationship.

The relationship is strong and significant

Main model: Life expectancy = $\beta_0 + \beta_1 \log(\text{GDP per capita}) + \varepsilon$

+4.14 years

per 1-unit increase in log GDP

$R^2 = 0.731$

model explains about 73% of variation

$p < 0.001$

statistically significant relationship

Association, not proof of causation.

How do field goal percentage and three point percentage impact an NBA team's win/loss percentage?

Win-Loss %

Field Goal %

$$\text{winloss} = \beta_0 + \beta_1 \cdot \text{fieldgoal} + \beta_2 \cdot \text{threepoint} + \varepsilon$$

$$y = -1.804 + 4.148x_1 + 1.138x_2$$

$$R^2 = 0.334$$

$$p < 0.001$$

Both field goal percentage and three point percentage are significantly associated with a team's win loss percentage, with field goal percentage having the higher effect

Does a worse economy affect whether UK citizens go to the polls more?

Darren Sung & Rafael Ferguson

Model: $VoterTurnout = \beta_0 + \beta_1 \cdot CPI + \beta_2 \cdot Unemployment + \varepsilon$

Change in CPI and Change in Voter Turnout vs. Year

Change in Voter Turnout and Change in Unemployment Rate vs. Year

Residual Plot

Lag Plot

OLS Assumption Violations:
Homoskedasticity and Independence

$$\beta_1 = 0.2933$$

- P-Value: 0.436

$$\beta_2 = 0.5198$$

- P-Value: 0.411

Residual Plot

Lag Plot

Conclusion: We found that while both an increase in inflation and unemployment rates lead to increased voter turnout, the relationship is not strong. Our predictions could have been by chance and are not concrete evidence of the proposed relationship.

Do Housing Supply Changes Predict Housing Prices?

Results:

- Model:

$$\text{Price}_{m,t} = \beta_0 + \beta_1 \text{Inventory}_{s,t} + \beta_2 \text{Time}_t + \gamma_m + \varepsilon_{m,t}$$

- Time Coefficient = -12.79
- P-value < 0.001
- Housing inventory declines ~12.8 units per month
- Lower inventory → higher housing prices

**How is the Philadelphia 76ers'
three-point field goal percentage related
to their point differential in games?**

...

Jaden Huynh

3 Point percentage vs Point Difference

- Point Differential
 - (Points scored - Points Allowed)
- Somewhat of a relationship between 3-point percentage and point differential
- Each 1 percentage point increase in 3P% is associated with a 0.54 point increase in point differential.

Null: 3P% has no effect on point differential ($B1 = 0$)

Alternative: 3P% has a positive effect on point differential ($B1 > 0$)

- Controlled for home games
- $p < 0.001$

Does carrier reliability predict geopolitical risk, controlling for if a shipment disruption occurs?

$$\text{Geopolitical_Risk_Score} = \beta_0 + \beta_1(\text{Carrier_Reliability Score}) + \beta_2(\text{Disruption_Occurred}) + \varepsilon$$

Does carrier reliability predict geopolitical risk, controlling for if a shipment disruption occurs?

Shipments where a disruption occurred were 1.34 points more dangerous on average, and high carrier reliability is associated with a .535 increase in geopolitical risk score.

β_1 p-val=0.04
 β_2 p-val=0.00

Tanishq Bansod and
Michael Fortunato

Is hitting or pitching more important for becoming a top-tier MLB franchise?

Distribution of Main Franchise Variables (Including Longevity)

Cross-sectional data of all 30 MLB franchises from the Lahman Database

Statistical Model: *Control Variable-Games Played*

$$\text{Win_Pct} = \text{beta_0} + \text{beta_1}(\text{Games}) + \text{beta_2}(\text{Home Runs}) + \text{beta_3}(\text{ERA})$$

While both hitting power and pitching efficiency are significant drivers of success, the magnitude of the ERA coefficient proves that elite pitching is the most critical factor in achieving a higher historical win percentage.

Pitching (ERA): For every 1-unit increase in career ERA, win percentage drops by 5.07 percentage points (beta 3 = -0.0507, $p = 0.001$).

Hitting (HR): For every additional home run hit, win percentage increases by 0.00076 percentage points (beta 2 = 0.000076, $p = 0.002$).

The plot shows residuals randomly distributed around zero, confirming that all OLS assumptions are satisfied and the results are statistically reliable.

Is GDP an indicator of total alcohol consumption in a given country?

Null Hypothesis: There is no relationship between GDP and total alcohol consumption in a given country and religion does not play a role in that comparison.

Alternative Hypothesis: There is a relationship between GDP and alcohol consumption and the majority religion in a given country influences that affect.

Model:

Baseline Equation: $\text{Total Alcohol} = \beta_0 + \beta_1(\log \text{GDP})$

Modified Equation: $\text{Total Alcohol} = \beta_0 + \beta_1(\log \text{GDP}) + \beta_2(\text{Religion}) + \beta_3(\log \text{GDP} \times \text{Religion}) + \epsilon$

Regression Results

Effect of GDP: p-value of 0.250

Effect of GDP on alcohol consumption per religion:

Buddhist: - 2.2252

Christian: -2.4678 (p-value 0.001)

Hindu: -0.9833

Judaism: -1.5780 (p-value 0.013)

Muslim: -0.9397

Conclusion:

Overall, we cannot reject the null hypothesis given our p-value.

However, majority religion does seem to have a stronger effect on total alcohol consumption in a county.

Does Home Attendance Affect an NHL Team's winning Percentage?

By Darius Bohinski

A dark blue diagonal gradient bar that starts from the bottom left corner and extends towards the top right corner, covering the lower half of the page.

Results

P-Value:

0.051

P-value suggests that home attendance does positively affect an NHL team's home winning percentage

Relationship Between Home Wins and Home Attendance (2024-2025)

$$\text{Equation: Home wins} = \beta_1 + \beta_2 * \text{capacity_}\% + E$$

Is there a home advantage for NFL teams?

Aidan Uher, Kevin Quigley, Micah Smith

$\text{point_margin} = -2.19 + 27.02 * \text{quality_diff} + \underline{4.38} * \text{is_home}$
p-values all <0.000

We can expect the home team to have a 4-5 point advantage

Did COVID-19 restrictions in 2020 affect home field advantage in the NFL — controlling for week of play, team strength, and divisional matchups?

Aiden McCoy and Wyatt McMullen – ECON 150 Spring 2026

6,000+

REGULAR SEASON GAMES

2002–2023

SEASONS ANALYZED

Point Diff > 0

HOME TEAM WINS!

MAIN RESULTS

Point Differential Non-Covid Season v. Covid Season (Controlled)

$$\text{Point Diff} = \beta_0 + \beta_1(\text{covid}) + \beta_2(\text{win_diff}) + \beta_3(\text{week}) + \beta_4(\text{div_matchup}) + \epsilon$$

Fans Matter

The results suggest the Covid-19 restrictions may have contributed to a near complete reduction in home field advantage, seen in the reduction of point differentials by 2.25 points on average ($p \approx 0.005$).

covid ≈ -2.25 pts | $p \approx 0.005$ | $R^2 \approx 0.2737$ (full model)

Does Geography Predict Income?

Regional and Urban/Rural Determinants of County Median Household Income

Does geography predict county income?

Urban counties earn ~\$10,020 more than rural counties regardless of region ($p < 0.001$).

Model: $\text{Income} = \beta_0 + \beta_1(\text{Northeast}) + \beta_2(\text{South}) + \beta_3(\text{West}) + \beta_4(\text{Urban}) + \beta_5(\text{NE} \times \text{Urban}) + \beta_6(\text{South} \times \text{Urban}) + \beta_7(\text{West} \times \text{Urban}) + \varepsilon$ | Baseline: Rural Midwest | $R^2 = 0.304$

Figure 1. Median household income by census region and urban/rural classification, 3,140 U.S. counties.

What did I find, and does the model hold up?

Urban/rural classification predicts income more than region alone, but OLS assumptions are violated and robust errors were applied.

- Being in an urban county raises income more than being in any particular region
- Rural counties in the South have the lowest incomes of any group in the country
- The income boost from being urban is largest in the Northeast and smallest in the West
- The model had assumption violations. A correction was applied so the results are still reliable

Figure 2. Residual plot: OLS assumption diagnostic.

Research Question:

How does Rising CO2 Concentration Affect Northern and Southern Hemisphere Temperature Anomalies?

$$\text{Global Average Temperature Change (}^{\circ}\text{C)} = 6.4676 + (0.0141 * \text{CO2_Value}) + (-0.0056 * \text{year})$$

6.4676 is the intercept, for every 1 unit increase in CO2 concentration (ppm), temperature increases by 0.0141 celsius, and for every additional year, temperature decreases by 0.0056 degrees celsius

Conclusion - Rising temperatures are strongly associated with rising CO2 concentrations. Although counterintuitive, year is assigned a negative value due to overlap in explanatory power, as temperature should rise over time

Can higher incomes keep up with rising home prices across U.S. cities?

Riley Prell

Median Household Income, Median Value of Homes, and Cities Affordability Ratio

Distribution of Key Housing Variables

Can higher incomes keep up with rising home prices across U.S. cities?

$$\text{AffordabilityRatio} = \beta_0 + \beta_1(\text{MedianIncome}) + \beta_2(\text{HomeValue}) + \varepsilon$$

Housing Affordability Model

Predicted vs. Actual Affordability Ratio

Income vs. Housing Affordability Ratio

Higher home prices make cities less affordable. While higher incomes help in cities like Honolulu and San Jose, home prices have risen so far that even high earners are priced out

95.1% variation in affordability explained

-0.60 drop in affordability ratio per \$10K income increase

+1.30 rise in affordability ratio per \$100K home price increase

The model struggles with outlier cities, these tend to be places on the coast where the prices skyrocket.

Residual Plot — OLS Assumptions Check

Are countries with more education spending happier?

Log GDP to
linearize the
relationship

Positive correlation
between GDP per
capita and
Happiness Score.

Results

For 1% increase in GDP allocated to education, the national happiness score is predicted to increase by 0.1917 points

$$\text{Happiness Score} = B_0 + B_1 (\text{GDP Spent on Education}) + B_2 (\text{GDP per capita}) + \varepsilon$$

How do CO₂ emissions compare between Europe and North America?

By Nolan Mikesell and Anthony Vanzin

H₀ (Null): $B_1 = 0$

- There is no statistically significant difference between the CO₂ emissions of Europe and North America over the last 60 years.

H_A (Alternative): $B_1 \neq 0$

- There is a statistically significant difference between the CO₂ emissions of Europe and North America over the last 60 years.

Aggregate CO2 Emissions Per Capita Distribution by Continent (1964-2024)

European Mean CO2 Emissions:
9.02 tonnes per capita.

North American Mean CO2
Emissions: **13.47 tonnes per capita.**

Regression Equation:

Emissions = 9.0232 + 4.449(Year)

- $B_0 = 9.0232$ (European μ)
- $B_1 = 4.449$ (Positive Slope)

P-value: **0.00001**

Conclusion: There is a statistically significant difference in mean CO2 emissions per capita between Europe and North America from the period 1964-2024.

Does an NHL Teams available Cap Space predict Win percentage?

By: Nate Werder and Ryan Charpentier

Research Question: Does available cap space predict an NHL team's win percentage?

Null Hypothesis: There is no correlation between an NHL team's win% and how much cap space they have available.

Data Source: Spotrac, a website that tracks NHL teams available cap, Total team payroll, Win percentage, and other statistics that we didn't use for our project. For our project we specifically looked at the 2024-2025 season.

$$\text{WIN\%}(\text{excluding ties}) = B_0 + B_1 * (\text{Cap Space Available}) + B_2 * (\text{Total Team Payroll})$$

B1(Cap Space Available) = $-6.81811\text{E-}09$, p-value = 0.619347181
B2(Total Team Payroll) = $1.72822\text{E-}08$, p-value of 0.007173717

The p-value for Cap Space Available being about 0.6193 tells us that there is a 61.93% chance that these results occurred due to random variation.

The p-value for Total Payroll Spent on players being about .007 tells us that there is only a 0.7% chance that our results occurred randomly.

The graph on slide 1 makes it seem like there is a correlation between cap space available and win percentage, as the data points are fairly spread out and the line of best fit shows the less available cap space, or available spending, you have, the higher your win percentage. Although the graph shows this, the p-value we calculated for cap space available is very high. A p-value of higher than 0.05 means that the results of the data are not statistically significant.

The Normative Value of Democracy

Bangladesh vs. Pakistan

Airah Shafiq

What did I study?

- Democracy = key global issue
- Focus on developing countries
- Compare Bangladesh & Pakistan
 - Look at income + gender

How important is democracy?

Does income affect views?

Does gender matter?

Differences between countries?

Data Source

World Values Survey (2018)

Bangladesh: N = 1200

Pakistan: N = 1855

I used Wave 7 of the World Values Survey from 2018. This is a large, cross-national dataset that measures people's beliefs and values. My sample includes about 1,200 people from Bangladesh and 1,855 from Pakistan."

Variables

Dependent:

- Democracy importance (1–10)

Independent:

- Income (low/mid/high)
- Gender (male/female)

Looking for how important democracy is to each respondent, measured on a scale from 1 to 10. Then I look at two key independent variables: income, which is grouped into low, middle, and high categories, and gender, coded as male or female

Summary Statistics

Bangladesh mean: 8.11

Pakistan mean: 8.37

Both countries show very high average support for democracy. Bangladesh has a mean of about 8.11, and Pakistan is slightly higher at 8.37. So overall, people in both countries strongly value democracy.

Shared history (British India, 1947 partition)

Bangladesh was part of Pakistan until 1971

Both majority Muslim countries

Different political trajectories

Useful comparison: similar roots, different outcomes

Bangladesh:

- More stable electoral democracy (recent decades)
- Strong party competition

Pakistan:

- History of military influence
- Less consistent democratic rule

Public trust shaped by these experiences

Visual Findings

Most responses near 10
Left-skewed distribution
“Ceiling effect”
Income:

- Bangladesh → middle
- Pakistan → lower

Methodology

OLS regression
Predict democracy importance
Variables:

- Income
- Gender

This allows me to estimate how income and gender predict the importance of democracy, while holding other factors constant.”

Results for Bangladesh

Income: +0.27

Female: -0.41

Both significant

In Bangladesh, income has a positive and statistically significant effect. This means that as income increases, support for democracy also increases. On the other hand, being female is associated with slightly lower support for democracy compared to males, and this result is also statistically significant.”

Results for Pakistan

Income: -0.27

Gender: not significant

In Pakistan, the results are actually very different. Income has a negative relationship with support for democracy, meaning higher-income individuals are less supportive. Gender, however, is not statistically significant, so it doesn't really affect attitudes toward democracy in Pakistan

Comparison

Bangladesh:

- Income $\uparrow \rightarrow$ support $\uparrow$
- Gender matters

Pakistan:

- Income $\uparrow \rightarrow$ support $\downarrow$
- Gender doesn't matter

When we compare the two countries, we see very different patterns. In Bangladesh, higher income increases support for democracy and gender plays a role. But in Pakistan, higher income actually decreases support, and gender has no meaningful effect.

Conclusion

- Democracy valued in both
- Drivers differ
- Context matters

To conclude, both countries strongly value democracy overall. However, the reasons behind that support differ. In Bangladesh, income and gender are important factors, while in Pakistan, income works in the opposite direction and gender is not important. This suggests that political attitudes are shaped by each country's unique social and economic context.

- Same outcome, different causes
- Income effects vary
- Culture matters

The key takeaway is that even though both countries show high support for democracy, the underlying causes are different. Income doesn't work the same way everywhere, and cultural context plays a major role in shaping political beliefs.
